Preface

This report is a product of the Long Term Resource Monitoring Program (LTRMP) for the Upper Mississippi River System. The LTRMP was authorized under the Water Resources Development Act of 1986 (Public Law 99-662) as an element of the U.S. Army Corps of Engineers' Environmental Management Program. The LTRMP is being implemented by the Environmental Management Technical Center, a U.S. Geological Survey science center, in cooperation with the five Upper Mississippi River System (UMRS) States of Illinois, Iowa, Minnesota, Missouri, and Wisconsin. The U.S. Army Corps of Engineers provides guidance and has overall Program responsibility. The mode of operation and respective roles of the agencies are outlined in a 1988 Memorandum of Agreement.

The UMRS encompasses the commercially navigable reaches of the Upper Mississippi River, as well as the Illinois River and navigable portions of the Kaskaskia, Black, St. Croix, and Minnesota Rivers. Congress has declared the UMRS to be both a nationally significant ecosystem and a nationally significant commercial navigation system. The mission of the LTRMP is to provide decision makers with information for maintaining the UMRS as a sustainable large river ecosystem given its multiple-use character. The long-term goals of the Program are to understand the system, determine resource trends and effects, develop management alternatives, manage information, and develop useful products.

Data (factual record) and information (usable interpretation of data) are the primary products of the LTRMP. Data on water quality, vegetation, aquatic macroinvertebrates, and fish are collected using a network of six field stations on the Upper Mississippi and Illinois Rivers. Analysis, interpretation, and the reporting of information are conducted at the six field stations and at the Environmental Management Technical Center, the operational center of the LTRMP. Informational products of the LTRMP include professional presentations, reports, and publications in the open and peer-reviewed scientific literature.

This document is an annual status report for 1993, containing a synthesis of data from fish populations and communities in the Upper Mississippi River System. This report satisfies, for 1993, Task 2.2.8.4, *Evaluate and Summarize Annual Results* under Goal 2, *Monitor and Evaluate the Condition of the Upper Mississippi River Ecosystem* as specified in the Operating Plan for the Long Term Resource Monitoring Program (USFWS 1993). This report was developed with funding provided by the Long Term Resource Monitoring Program. The purposes of this annual synthesis report are to provide (1) a systemwide summary of data in standardized tables and figures, and (2) initial identification and interpretation of observed spatial and temporal patterns. The primary data summarized in this report are available from the Environmental Management Technical Center.

1993 Annual Status Report

A Summary of Fish Data in Six Reaches of the Upper Mississippi River System

Abstract

The Long Term Resource Monitoring Program (LTRMP) completed 1,994 collections of fishes from stratified random and permanently fixed sampling locations in six study reaches of the Upper Mississippi River System during 1993. Collection methods included day and night electrofishing, hoop netting, fyke netting (two net sizes), gill netting, seining, and trawling in select aquatic area classes. The six LTRMP study reaches are Pools 4 (excluding Lake Pepin), 8, 13, and 26 of the Upper Mississippi River, an unimpounded reach of the Mississippi River near Cape Girardeau, Missouri, and the La Grange Pool of the Illinois River. A total of 62–78 fish species were detected in each study reach. For each of the six LTRMP study reaches, this report contains summaries of: (1) sampling efforts in each combination of gear type and aquatic area class, (2) total catches of each species from each gear type, (3) mean catch-per-unit of gear effort statistics and standard errors for common species from each combination of aquatic area class and selected gear type, and (4) length distributions of common species from selected gear types.

Introduction

The objective of this report is to summarize key features of fish populations and communities from samples collected by field stations of the Long Term Resource Monitoring Program (LTRMP) from the Upper Mississippi River System (UMRS). The fisheries component of the LTRMP is charged, in part, with monitoring and reporting trends in the status of selected fish populations and fish communities of the UMRS (USFWS 1993). Intended as a data summary, this report contains only minimal descriptive syntheses. The LTRMP is required to produce trend reports at 5-year intervals that contain quantitative analyses and systemic syntheses of temporal changes. Further, the LTRMP uses these monitoring data in analyses to address specific issues of concern to LTRMP partners; these analyses are reported in special reports and in the open scientific literature.

Fish are the primary biotic object of recreational and commercial use on the UMRS. During 1982, UMRS fisheries provided more than 8.5 million activity days of sportfishing that generated more than \$150 million in direct expenditures (Fremling et al. 1989). Commercial fisheries of the UMRS were valued at more than \$2.4 million in 1987 (UMRCC 1989). Adverse trends in fisheries of the UMRS would have detrimental effects on recreation and the regional economy. Therefore, it is important to detect any adverse trends as they occur so that remedial actions can be considered.

Monitoring of and research on fish are also important because fish often affect other ecosystem elements. Although documentation of the effects of fish on other biota is derived primarily from lakes and reservoirs (Northcote 1988), and traditional thought maintains that the dynamics of river biota are influenced primarily by abiotic factors, recent evidence shows that the dynamics of fish assemblages in temperate rivers are regulated in part by biotic factors (Welcomme et al. 1989). Fish may exert influences on other biota in riverine ecosystems and may, therefore, be of broad ecological importance. For example, evidence shows that common carp (*Cyprinus carpio*), an abundant species in the UMRS, may depress or even eliminate macrophytes either through uprooting or disturbance of substrate (Cahn 1929; Macrae 1979). Effects of fish on benthic

macroinvertebrates are well known (Northcote 1988). Therefore, trends in abundance of fish may be crucial in explaining trends in abundance of other riverine biota.

Resource monitoring is an important component of long-term ecological research on processes governing large-scale ecosystems. It is nearly impossible to perform experimental manipulations of the UMRS on large spatial scales and to incorporate replication. Long-term data from standardized sampling programs that span natural or anthropogenic disturbances are the only means for gaining an understanding of large-scale processes governing large river systems (Sparks et al. 1990). Further, the LTRMP fisheries component will provide support for the formulation and investigation of research hypotheses concerning smaller scales using focused experimentation. Therefore, the combination of routine monitoring coupled with more intensive investigation of consequences of disturbances and experimentation at reduced spatial and temporal scales is the only available means for better understanding the UMRS and for identifying viable management alternatives.

Study Areas

The LTRMP study areas include six river reaches within the Upper Mississippi River System, five on the Mississippi River and one on the Illinois River (Figure). Study areas are referred to herein by the navigation pool designations according to the U.S. Army Corps of Engineers lock and dam system. Mississippi River navigation pools studied are Pool 4 (river mile 752 to 797), Pool 8 (679 to 703), Pool 13 (523 to 557), Pool 26 (202 to 242), and an unimpounded, open river reach (29 to 80). The remaining study area is the La Grange Pool of the Illinois River (80 to 158).

The LTRMP study areas were chosen, in part, to reflect important differences in geomorphology, floodplain land-use practices, and navigation management strategies that exist within the UMRS (Table 1). Pools 4, 8, and 13 are located in an upper impounded reach characterized by high percentages of open water and aquatic vegetation and low agricultural use (Figure). Relatively high percentages of the total aquatic area in these study reaches are composed of contiguous (to the main channel) backwaters, and relatively low percentages are composed of main channel (Table 1). Qualitatively, Pools 4, 8, and 13 are geomorphically complex and richly braided by side channels and backwaters. Pool 26, in a lower impounded reach, is characterized by relatively low percentages of open water and aquatic vegetation and a high percentage of agriculture in the floodplain. A low percentage of the total aquatic area is composed of contiguous backwaters, and commensurately, a high percentage is composed of the main channel. The Open River study reach is characterized by low percentages of open water and aquatic vegetation and 71.5% agriculture in the floodplain. Of the total aquatic area in the Open River study reach, only 1.8% is contiguous backwater and 79% is main channel (Table 1). The La Grange Pool is similar to Pool 26 in floodplain composition, but is similar to Pools 8 and 13 in composition of the aquatic area (Table 1). In fact, the La Grange Pool has the greatest percentage (52.2%) of contiguous backwaters among the six LTRMP study areas.

Sampling sites are randomly selected within nine strata for each study area: backwater contiguous shoreline (BWCS), backwater contiguous offshore (BWCO), impounded shoreline (IMPS), impounded offshore (IMPO), main channel border unstructured (MCBU), main channel border wing dam (MCBW), side channel border (SCB), tributary mouth (TRI), and tailwater (TWZ). The definitions of sampling strata are based on geomorphic regions that have been mapped and entered into a Geographical Information System.

Figure. Long Term Resource Monitoring Program study reaches.

Table 1. Key features of the floodplain and aquatic area compositions of the Long Term Resource Monitoring Program's five Mississippi and Illinois River study reaches. Aquatic area is that portion of the floodplain that is inundated at normal water elevations. Main channel includes area in the navigation channel and main channel border areas. Data on floodplain composition are from Lastrup and Lowenberg (1994). Data on the composition of aquatic areas are from the Long Term Resource Monitoring Program aquatic areas spatial database.

Study reach	Floodplain area (ha)	Floodplain composition (%)			Aquatic area composition (%)	
		Open water	Aquatic vegetation	Agriculture	Contiguous backwater	Main channel
Pool 4	28,358	50.5	10.0	12.1	21.3	10.5
Pool 8	19,068	40.1	14.4	0.9	30.6	14.2
Pool 13	34,528	29.7	8.6	27.9	28.5	24.7
Pool 26	51,688	13.4	1.4	65.4	17.3	54.4
Open River	105,244	9.9	0.6	71.5	1.8	79.0
La Grange Pool, Illinois River	89,554	15.7	2.2	59.6	52.2	21.3

Methods

Sampling Methods

The LTRMP fish monitoring design and sampling protocols, including historical changes, are given in Gutreuter et al. (1995). Readers requiring detailed descriptions should refer to that report. An abbreviated description of the LTRMP design and protocols follows; a list of common and scientific names of fish used in this report is found in Table 2.

In this report, we summarize the annual increment of fish data obtained by the LTRMP from stratified random and fixed-site sampling during 1993. The LTRMP converted to a stratified, random fish sampling design in 1993, augmented with limited sampling at a few permanently fixed sites. Selected aquatic areas, chosen for their enduring geomorphic features (Wilcox 1993), were used as sampling strata. These aquatic areas were largely compatible with the habitat classes used in 1990–92, with the exception of the 1990–92 classifications, which were based on the presence of aquatic vegetation; those fixed sites were reclassified into strata according to aquatic areas. Each aquatic area is artificially partitioned into 50-m² sampling grids beginning with a random origin for each LTRMP study reach (Gutreuter et al. 1995) using the ARC Geographic Information System. Beginning in 1993, sampling sites were randomly chosen from this lattice of square grids. Whenever it is discovered that a randomly selected site cannot be sampled because of environmental constraints (e.g., limited physical access or high flow), the nearest accessible site from a list of randomly selected alternate sites is sampled within the same aquatic area class.

Table 2. Long Term Resource Monitoring Program list of fishes, arranged phylogenetically by family, then alphabetically by genus and species. Hybrids are listed after respective genera. Nomenclature follows Robins et al. (1991).

Common name	Family name	Scientific name
Petromyzontidae		
Chestnut lamprey		<i>Ichthyomyzon castaneus</i>
Northern brook lamprey		<i>I. fossor</i>
Silver lamprey		<i>I. unicuspis</i>
Least brook lamprey		<i>Lampetra aepyptera</i>
American brook lamprey		<i>L. appendix</i>
Sea lamprey		<i>Petromyzon marinus</i>
Carcharhinidae		
Bull shark		<i>Carcharhinus leucas</i>
Acipenseridae		
Lake sturgeon		<i>Acipenser fulvescens</i>
Pallid sturgeon		<i>Scaphirhynchus albus</i>
Shovelnose sturgeon		<i>S. platyrhynchus</i>
Polyodontidae		
Paddlefish		<i>Polyodon spathula</i>
Lepisosteidae		
Spotted gar		<i>Lepisosteus oculatus</i>
Longnose gar		<i>L. osseus</i>
Shortnose gar		<i>L. platostomus</i>
Alligator gar		<i>L. spatula</i>
Amiidae		
Bowfin		<i>Amia calva</i>
Hiodontidae		
Goldeye		<i>Hiodon alosoides</i>
Mooneye		<i>H. tergisus</i>
Anguillidae		
American eel		<i>Anguilla rostrata</i>
Clupeidae		
Alabama shad		<i>Alosa alabamae</i>
Skipjack herring		<i>A. chrysochloris</i>
Alewife		<i>A. pseudoharengus</i>
Gizzard shad		<i>Dorosoma cepedianum</i>
Threadfin shad		<i>D. petenense</i>

Mugilidae		
Striped mullet		<i>Mugil cephalus</i>

Since 1990, the LTRMP uses day and night electrofishing, fyke nets, seines, small mini fyke nets, hoop nets, and small trawls to sample fish in various strata. The following is a summary of sampling gears according to Gutreuter et al. (1995):

Electrofishing

Electrofishing is conducted with pulsed direct current; boat configuration and power output are standardized (Burkhardt and Gutreuter 1995; Gutreuter et al. 1995). Electrofishing effort is of 15-min duration and is paced so that the boat covers a rectangle of about 200×30 m. Day and night electrofishing data from these two methods were combined for length–frequency analysis. The unit of effort is a 15-min run.

Hoop Netting

The LTRMP uses two sizes of hoop nets. The large nets are composed of seven fiberglass hoops with diameters of 1.1 to 1.2 m. These nets are 4.8 m long, contain two finger-style throats, and are constructed of 3.7-cm (bar measure) nylon mesh. The small nets are composed of seven fiberglass hoops with diameters of 0.5 to 0.6 m. The small nets are 3 m long, contain two finger-style throats, and are constructed of 1.8-cm (bar measure) nylon mesh. Hoop nets are deployed separately but in pairs within sampling sites. Both nets are baited with 3 kg of soybean cake. For this report, the estimates from pairs of nets are pooled and therefore treated as a single gear for consistency with the 1990–92 data. The unit of effort is a net-day, which is 24 h of effort by a pair of nets.

Seining

The LTRMP uses 10.7-m-long seines constructed of 3-mm Ace-type nylon mesh. These seines are 1.8 m high and have a 0.9-m^2 bag in the centers. Seines are extended perpendicularly to shorelines and then swept in a 90° arc downstream to the shoreline. The unit of effort is a haul.

Fyke Netting

The LTRMP uses Wisconsin-type fyke nets (trap nets) that contain three sections: the lead, frame, and cab. All netting is 1.8-cm (bar measure) mesh. Leads are 15 m long and 1.3 m high. The spring steel frames are 0.9 m high and 1.8 m wide with two internal wing throats. The cabs are constructed of six steel hoops (0.9 m in diameter) containing two throats. These nets are fished singly from shoreline or from beds of dense vegetation or in tandem (with leads connected) offshore. The unit of effort is a net-day, where each frame is one net. Fyke net and tandem fyke net data were combined for length–frequency distribution analysis.

Mini Fyke Netting

Mini fyke nets are small, Wisconsin-type fyke nets. Mesh size is 3-mm Ace-type nylon. The leads are 4.5 m long and 0.6 m high. The spring steel frames are 0.6 m high and 1.2 m wide with two internal wing throats. The cabs are constructed of two steel hoops (0.6 m in diameter) with one throat. These nets are fished singly from shoreline or from beds of dense vegetation or in tandem (with leads connected) offshore. The unit of effort is a net-day, where each frame is one net.

Trawling

Trawling is conducted only at permanently fixed sampling sites in tailwater zones and unstructured channel borders. The LTRMP trawls collect mainly small, bottom-dwelling fish. The trawls are two-seam, 4.8-m slingshot balloon trawls (TRL16BC, Memphis Net and Twine Co., Inc., or the equivalent). The body of the trawl is made of No. 9 nylon with stretch mesh 18 mm in diameter. The cod end is made of No. 18 nylon with stretch mesh 18 mm in diameter. The cod end contains a 1.8-m liner consisting of 3-mm Ace-type nylon mesh. Floats are spaced every 0.91 m along the headrope, and a 4.8-mm steel chain is tied to the footrope. The trawl is equipped with 37-cm-high by 75-cm-long iron "V" doors (otter boards). These trawls are dragged downriver by small, flat-bottomed boats. Trawl speed is barely faster than ambient current speed. The standard unit of trawl effort is a haul. A minimum of six hauls is collected in main or side channel sites and four hauls at tailwater sites.

Gill Netting

In 1993, gill nets became an optional experimental sampling gear. This option was included to improve monitoring capabilities for some large riverine species. Gill nets are 91.44 m long and consist of four, 22.86-m panels of monofilament mesh. The panels are 2.44 m deep. Each panel consists of different mesh of 10.2-, 20.3-, and 25.4-cm stretch measure. The 10.2- and 15.2-cm mesh are woven from No. 8 (9.07-kg [20-pound] test) transparent nylon monofilament. The 25.4-cm mesh is woven from No. 12 (13.61-kg [30-pound] test) transparent nylon monofilament. The top line is floating foam-core rope and the bottom line is 29.50-kg lead-core rope. Gill nets are set either perpendicularly (preferred) or parallel (in high-flow conditions) to the shoreline. The standard unit of gill netting effort is the net-day, where a day is 24 h.

Statistical Methods

The LTRMP uses mean catch-per-unit-effort C/f as an index of abundance, as is conventional practice (Ricker 1975). The units of effort are specific to particular gears. For electrofishing and seining, effort is a constant, but for other gears it is somewhat variable. For example, although the effort goal for fyke nets is 1 day (Gutreuter et al. 1995), actual effort may vary between 20 and 30 h. Catch and effort are recorded for each species from individual samples (deployments of particular gears) at unique combinations of time and place. Whenever a species is not caught in a sample, the catch for that species in that sample is zero. Although these zero catches are not recorded, they are reconstructed for analyses.

The estimates of pooled reachwide mean C/f were obtained from the conventional design-based estimator for stratified random samples (Cochran 1977). For an arbitrary random variable denoted y (for this report y represents C/f), the pooled mean, denoted \bar{y}_{st} (st represents stratified) is given by

$$\bar{y}_{st} = \frac{1}{N} \sum_{h=1}^L N_h \bar{y}_h \quad (1)$$

where N_h is the number of sampling units within stratum h , $N = \sum_{h=1}^L N_h$, and \bar{y}_h denotes the estimator of the simple mean of y for stratum h . The estimator of the variance of \bar{y}_{st} is

$$s^2(\bar{y}_{st}) = \frac{1}{N^2} \sum_{h=1}^L N_h (N_h - n_h) \left(\frac{s_h^2}{n_h} \right) \quad (2)$$

where

$$s_h^2 = \frac{\sum_{i=1}^{n_h} (y_{hi} - \bar{y}_h)^2}{n_h - 1}$$

is the usual estimator of the variance of y_h and n_h is the number of samples taken in stratum h (Cochran 1977). The standard error of \bar{y}_{st} is therefore $s(\bar{y}_{st})$. For LTRMP fish monitoring, the sampling units are 50-m² sampling grids.

In this report, C/f statistics are reported separately for the limited, fixed-site sampling and the primary stratified random sampling. Equation (1) is used to estimate means of data obtained from fixed-site sampling to maintain computational consistency. The pooled means from fixed-site sampling are not guaranteed unbiased because there is no assurance that the fixed sites were unbiased within the stratum. Equation (1) is also used to obtain estimates of overall mean catch-per-unit-effort from stratified random sampling. In random samples, equation (1) yields unbiased estimates of the pooled means regardless of the probability distribution of y (Cochran 1977).

Length distribution analysis was performed for 13 selected fish species (gear used): gizzard shad (electrofishing), common carp (electrofishing), smallmouth buffalo (electrofishing; large and small hoop netting), channel catfish (electrofishing; large and small hoop netting), northern pike (electrofishing; fyke and tandem fyke netting), white bass (electrofishing), bluegill (electrofishing; fyke and tandem fyke netting), largemouth bass (electrofishing), white crappie (electrofishing; fyke and tandem fyke netting), black crappie (electrofishing; fyke and tandem fyke netting), sauger (electrofishing), walleye (electrofishing), and freshwater drum (electrofishing; fyke and tandem fyke netting). The data are illustrated in the form of histograms within the following chapters. In some instances, meaningful biological interpretation of these distributions may be limited by small sample size or size selectivity of the gear (Anderson and Neumann 1996). Some fish histograms with small sample sizes (<100) are included in this report because of local interest, while others were omitted (reach dependent).

Acknowledgments

This report is a result of the efforts of the staff and partners of the Long Term Resource Monitoring Program (LTRMP) of the Upper Mississippi River. The LTRMP is a cooperative effort by the U.S. Geological Service—Biological Resources Division, the U.S. Army Corps of Engineers, the U.S. Fish and Wildlife Service, the Illinois Department of Natural Resources, the Iowa Department of Natural Resources, the Minnesota Department of Natural Resources, the Missouri Department of Conservation, and the Wisconsin Department of Natural Resources. Monitoring is conducted by six field stations operated by the participating state resource management and research agencies. We especially thank the staff at the LTRMP field stations for their sampling assistance.

Lake City, Minnesota 55041

Hydrograph

Water levels in the Lock and Dam 3 tailwaters exceeded the 1940 to 1992 mean elevations throughout most of the year (Figure 1.1). Sampling was suspended during the first period at the peak of the 1993 flood. Wing dams were not sampled during periods 1 or 2 because of the high flows.

Figure 1.1. Daily water surface elevation from Lock and Dam 3 for Pool 4, Upper Mississippi River, during 1993 and mean elevation since 1940. The U.S. Army Corps of Engineers discharge data were obtained from the Environmental Management Technical Center (Wlosinski et al. 1995).

Summary of Sampling Effort

In 1993, we completed 387 collections at randomly selected and fixed sites (Table 1.1). Fixed-site samples comprised 36 collections in the TWZ and 9 collections in the MCBW.

Total Catch by Gear

We collected 12,833 fish representing 73 species and three hybrids in 1993 (Table 1.2). Historically, 99 species have been documented in Pool 4 (Pitlo et al., 1995). In 1993, the most numerically abundant species (and total catches) were the emerald shiner (3,403), bluegill (1,432), common carp (1,180), gizzard shad (723), and spotfin shiner (718). Total catches by gear were by day electrofishing, 5,059; night electrofishing, 1,118; fyke net, 544; tandem fyke net, 1,180; mini fyke, 1,109; tandem mini fyke, 276; seine, 2,712; small hoop net, 158; large hoop net, 438; gill net, 288; and trawl, 1.

Random Sampling, Mean *C/f* by Gear and Stratum

Day Electrofishing

We collected 55 species by day electrofishing (Table 1.2). Species with the highest poolwide mean catch-per-unit-effort (*C/f*) in day electrofishing collections (Table 1.3.1) were the emerald shiner (97/h = 4 × 24.3/15-min run), gizzard shad (40/h), and common carp (26/h). The emerald shiner was the most commonly caught species by electrofishing in three strata: BWCS (138/h), MCBU (239/h), and SCB (93/h). The gizzard shad predominated in the BWCO (23/h) and in the MCBW; the highest *C/f* was for the shorthead redhorse (40/h). Four species taken by electrofishing were not collected by any other gear. These were the chestnut lamprey, silver lamprey, orangespotted sunfish, and crystal darter.

Fyke Net

We collected 30 species in fyke nets in the BWCS (Table 1.2), including the only brown bullhead collected in 1993. The *C/f* in fyke nets (Table 1.3.2) were highest for the black crappie (6/net-day) and the bluegill and common carp (3 each/net-day).

Tandem Fyke Net

Thirty-one species were collected in tandem fyke nets in the BWCO (Table 1.2). The most commonly caught species (Table 1.3.3) were the black crappie (7/net-day), common carp (4/net-day), and bluegill (3/net-day). The yellow bullhead was collected solely by this gear in 1993.

Mini Fyke Net

We collected 36 species in mini fyke nets (Table 1.2). Poolwide *C/fs* (Table 1.3.4) were highest for the bluegill (16/net-day) and pugnose minnow (2/net-day). The bluegill was the most common species in collections from the BWCS (54/net-day) and the SCB (4/net-day). The spotfin shiner was the most abundant species in mini fyke net collections from the MCBU (2/net-day). One species, the slenderhead darter, was collected solely by this gear.

Tandem Mini Fyke Net

We collected 31 species in tandem mini fyke nets in the BWCO (Table 1.2). The most commonly caught species (Table 1.3.5) were the tadpole madtom (1/net-day) and the emerald shiner (0.7/net-day). Three species were collected solely in tandem mini fyke nets in 1993—the stonecat, central mudminnow, and pirate perch.

Small Hoop Net

We collected 13 species in small hoop nets (Table 1.2). The highest poolwide *C/fs* (Table 1.3.6) were for the common carp (0.7/net-day) and channel catfish (0.5/net-day).

Large Hoop Net

We collected 18 species in large hoop nets (Table 1.2). Poolwide, the most commonly caught species (Table 1.3.7) were the common carp (2/net-day) and channel catfish (1/net-day). The common carp was the most frequently caught species in the BWCO (3/net-day). In the SCB, the highest *C/f* was for the white bass (1/net-day). The smallmouth buffalo had the highest *C/f* in the MCBU (0.8/net-day). The sole highfin carpsucker collected in 1993 was caught in a large hoop net.

Seine

We collected 40 species in the seine (Table 1.2), including the sole specimens of the banded darter and speckled chub taken during 1993. Poolwide *C/fs* in the seine (Table 1.3.8) were highest for the emerald shiner (28/haul), spotfin shiner (13/haul), and river shiner (6/haul). The emerald shiner was the most frequently collected species in the SCB (37/haul); in the MCBU, the spotfin shiner had the highest catch rate (19/haul).

Gill Net

We collected 25 species in gill nets (Table 1.2) including the only specimens of the goldeye and blue sucker caught in 1993. The highest poolwide *C/fs* (Table 1.3.9) were for the common carp (3/net-day), smallmouth buffalo (1/net-day), and freshwater drum (1/net-day). The common carp had the highest *C/f* in the BWCO (4/net-day), MCBU (2/net-day), and SCB (2/net-day) strata.

Fixed Sampling, Mean *C/f* by Gear and Stratum

Night Electrofishing

The *C/f* for 36 species collected by night electrofishing at fixed sites in the TWZ are reported in Table 1.4.1. The highest *C/fs* were for the common carp (67/h), freshwater drum (61/h), and sauger (46/h).

Fyke Net

The *C/f* for 10 species collected in fyke nets at fixed sites are reported in Table 1.4.2. The highest *C/fs* were for the freshwater drum (11/net-day) and white bass (7/net-day).

Mini Fyke Net

The *C/f* for 14 species collected in mini fyke nets at fixed sites in the TWZ are reported in Table 1.4.3. Mini fyke net *C/fs* were highest for the emerald shiner and gizzard shad (4 each/net-day) and the spotfin shiner (1/net-day).

Small and Large Hoop Nets

The common carp was the most frequently collected species in small hoop nets at fixed sites (Table 1.4.4) in the TWZ (1/net-day) stratum. The *C/fs* in large hoop nets (Table 1.4.5) in the TWZ were highest for the common carp (0.4/net-day) and freshwater drum (0.4 each/net-day).

Trawl

Channel catfish was the only species collected by trawling in the TWZ stratum (Table 1.4.6).

Length Distributions of Selected Species

Gizzard Shad

The modal length of 680 gizzard shad collected by electrofishing was 4 cm, and the maximum length was 48 cm (Figure 1.2). The majority of the gizzard shad in this sample were less than 14 cm long.

Common Carp

The modal length of 690 common carp collected by electrofishing was 46 cm (Figure 1.3). The maximum length was 80 cm, and the minimum length was 24 cm.

Smallmouth Buffalo

The modal length of 27 smallmouth buffalo collected by electrofishing was 50 cm (Figure 1.4). The 66 smallmouth buffalo collected in hoop nets ranged in length from 40 to 60 cm, and the modal length was 46 cm (Figure 1.5).

Channel Catfish

The length distribution of 20 channel catfish collected by electrofishing was bimodal, with peaks at 44 and 48 cm (Figure 1.6). The 126 channel catfish collected in hoop nets ranged in length from 18 to 80 cm, with modes at 36 and 44 cm (Figure 1.7).

Northern Pike

The lengths of 30 northern pike collected by electrofishing ranged from 8 to 96 cm (Figure 1.8). Lengths of 23 northern pike collected in fyke nets ranged from 20 to 88 cm (Figure 1.9).

White Bass

The length distribution of 159 white bass collected by electrofishing is presented in Figure 1.10. Lengths ranged from 4 to 38 cm, with modes at 18 and 34 cm.

Bluegill

The modal length of 382 bluegills collected by electrofishing was 2 cm, and the maximum length was 22 cm (Figure 1.11). The 219 bluegills collected in fyke nets ranged in length from 4 to 24 cm, and the modal length was 16 cm (Figure 1.12).

Largemouth Bass

The length distribution of 80 largemouth bass collected by electrofishing is presented in Figure 1.13. Lengths ranged from 2 to 48 cm. The modal length was 8 cm.

Black Crappie

The lengths of 446 black crappies collected in fyke nets ranged from 6 to 30 cm (Figure 1.14). The modal length was 12 cm.

Sauger

The length distribution of 197 saugers collected by electrofishing is presented in Figure 1.15. Lengths of saugers ranged from 10 to 48 cm, and the modal length was 18 cm.

Walleye

The length distribution of 102 walleyes collected by electrofishing is presented in Figure 1.16. Individuals ranged from 8 to 68 cm in length, and the modal length was 38 cm.

Freshwater Drum

Freshwater drum collected by electrofishing ranged from 4 to 54 cm in length, and the modal length was 26 cm (Figure 1.17). Freshwater drum collected in fyke nets were 10 to 46 cm long, and the modal length was 32 cm (Figure 1.18).

Table 1.1. Allocation of fish sampling effort among strata by the Long Term Resource Monitoring Program in Pool 4 of the Mississippi River during 1993. Table entries are numbers of successfully completed standardized monitoring collections.

Hydrograph

The 1993 hydrograph for Pool 8 (Figure 2.1) indicated high water levels for the entire ice-free season. The river reached flood stage for 2 weeks in April and did not return to normal levels until mid-October. In late June, water levels again rose sharply, crested about 4 feet above flood stage, and remained above flood stage for most of July. Though river stages declined steadily from late July through early October, higher than normal water levels persisted until the middle of the third sampling period. Water levels significantly affected sampling in 1993. Many primary sites could not be sampled, and alternate sites were used for 22.5% of all collections, primarily during the flood.

Figure 2.1. Daily water surface elevation from Lock and Dam 7 for Pool 8, Upper Mississippi River, during 1993 and mean elevation since 1940. The U.S. Army Corps of Engineers discharge data were obtained from the Environmental Management Technical Center (Wlosinski et al. 1995).

Summary of Sampling Effort

We made 580 fish collections in Pool 8 during 1993 (Table 2.1). Gear allocations across strata remained fairly consistent for all three sampling periods. The main exceptions were that BWCS fixed-site collections were eliminated in period 1 because of high water, and seining (MCBU) and fyke netting (BWCS) effort was increased for periods 2 and 3. Of the 580 collections, 502 were from randomly selected sites in the BWCO, BWCS, IMPO, IMPS, SCB, MCBU, and MCBW strata. Fifty-four collections were made at fixed TWZ sites, and 24 were from two fixed BWCS sites. The BWCS, SCB, and MCBU strata received the most sampling effort.

Total Catch by Gear

We collected 28,420 fish representing 78 species and four hybrid crosses in 1993 (Table 2.2). This total does not include 112 fish <30 mm long identified only to family or genus. The five most abundant species in our samples were spotfin shiner (6,463), bluegill (4,245), emerald shiner (3,040), black crappie (1,940), and common carp (1,065). Total species (excluding hybrids) collected by gear type were day electrofishing (58), night electrofishing (63), fyke netting (35), tandem fyke netting (30), mini fyke netting (50), tandem mini fyke netting (23), seining (55), small hoop netting (17), large hoop netting (23), gill netting (12), and trawling (6). Fish distribution records for the Upper Mississippi River (Pitlo et al. 1995) document 99 fish species from Pool 8. Our species total before the 1993 season was 74; 10 new species, American brook lamprey, skipjack herring, brassy minnow, channel shiner, black buffalo, hog sucker, rainbow smelt, brown trout, burbot, and Iowa darter were added in 1993, bringing the cumulative total to 84. In 1993, we collected 1 skipjack herring, 2 crystal darters, and 5 pallid shiners, all of which are on Wisconsin's endangered species list. We also collected 1 black buffalo and 69 river redhorse in 1993, both listed as threatened in Wisconsin.

Random Sampling, Mean *C/f* by Gear and Stratum

Day Electrofishing

For day electrofishing (Table 2.3.1), spotfin shiner had the highest reachwide mean *C/f* (20.13), followed by common carp (9.05) and emerald shiner (6.01). Following are the fish species with the highest *C/f* within each stratum type: BWCS (bluegill, 12.68), IMPS (spottail shiner, 12.31), MCBU (emerald shiner, 11.85), MCBW (emerald shiner, 3.94), and SCB (spotfin shiner, 35.28).

Night Electrofishing

For night electrofishing (Table 2.3.2), emerald shiner (9.58), shorthead redhorse (7.88), and sauger (6.29) had the highest reachwide mean *C/f*s. Following are the fish species with the highest *C/f* within each stratum type: BWCS (emerald shiner, 12.29), MCBU (emerald shiner, 14.05), MCBW (shorthead redhorse, 8.61), and SCB (spotfin shiner, 6.76).

Fyke Net

Reachwide mean *C/f*s for fyke netting (Table 2.3.3) were highest for black crappie (29.25), bluegill (15.31), and shortnose gar (4.69). Black crappie also had the highest mean *C/f* in the BWCS (31.23) and IMPS (15.63) strata.

Tandem Fyke Net

Reachwide mean *C/f*s for tandem fyke netting (Table 2.3.4) were highest for black crappie (3.64), followed by freshwater drum (1.87) and shorthead redhorse (1.02). These species had the highest *C/f* within each stratum type: BWCO (black crappie, 28.33) and IMPO (freshwater drum, 1.50).

Mini Fyke Net

Bluegill (28.57) had the highest reachwide mean *C/f* for mini fyke nets (Table 2.3.5), followed by pugnose minnow (8.92) and spotfin shiner (8.27). Bluegill also dominated *C/f* for mini fyke nets in the BWCS (47.49) and SCB (28.83) strata. Spotfin shiner had the highest *C/f* in the IMPS (11.75), MCBU (6.42), and MCBW (1.17) strata.

Tandem Mini Fyke Net

Spotfin shiner (0.25) had the highest reachwide mean *C/f* for tandem mini fyke netting (Table 2.3.6), followed by channel shiner (0.20), bluegill (0.18), and freshwater drum (0.18). Spotfin shiner had the highest mean *C/f* in the BWCO stratum (1.42), and channel shiner *C/f* (0.23) was the highest in the IMPO stratum.

Small Hoop Net

For small hoop nets (Table 2.3.7), channel catfish had the highest reachwide mean *C/f* (1.23) and the highest *C/f* for each stratum type: BWCO (0.58), IMPO (1.60), MCBU (0.93), MCBW (1.24), and SCB (0.45). The next highest reachwide mean *C/f*s were held by shorthead redhorse (0.39) and common carp (0.21).

Large Hoop Net

For large hoop nets (Table 2.3.8), smallmouth buffalo had the highest reachwide mean *C/f* (0.91), followed by channel catfish (0.61) and common carp (0.52). Channel catfish had the highest stratumwide *C/f* for large hoop nets in the BWCO (0.75) and SCB (0.57) strata. In the IMPO (1.20) and MCBU (0.88) strata, smallmouth buffalo had the highest *C/f*. Shorthead redhorse (0.29) had the highest mean *C/f* in the MCBW stratum.

Seine

Spotfin shiner (45.13) had the highest reachwide mean *C/f* for seining (Table 2.3.9), followed by emerald shiner (13.92) and bluegill (8.15). Following are the fish species with the highest *C/f* within each stratum type: BWCS (bluegill, 22.56), MCBU (spotfin shiner, 27.00), and SCB (spotfin shiner, 91.63).

Gill Net

Common carp (0.38) had the highest reachwide mean *C/f* for gill nets (Table 2.3.10). Freshwater drum (0.33) and silver redhorse (0.15) had the next highest reachwide catch rates. Common carp (0.51) had the highest mean *C/f* from the IMPO stratum, and shovelnose sturgeon (0.50) was most abundant in SCB gill nets. No fish were collected from the MCBU stratum in gill nets.

Fixed Sampling, Mean *C/f* by Gear and Stratum

Day Electrofishing

For day electrofishing in 1993 at the two BWCS fixed sites in Pool 8, spotfin shiner (37.93) had the highest mean *C/f* (Table 2.4.1). Emerald shiner (15.75) and bluegill (10.45) were the next most abundant.

Night Electrofishing

Night electrofishing, conducted at four TWZ fixed sites in 1993 (Table 2.4.2), yielded sauger (*C/f* = 29.67) in greatest abundance. The next highest mean *C/f*s for tailwater night electrofishing were for freshwater drum (16.07) and smallmouth bass (12.31).

Fyke Net

Bluegill (28.20) had the highest *C/f* for fyke nets at two BWCS fixed sites (Table 2.4.3). The following fish species had the next highest catch rates: black crappie (21.89) and yellow perch (3.91).

Mini Fyke Net

For mini fyke netting at the TWZ fixed sites (Table 2.4.4), spotfin shiner (18.22) had the highest mean *C/f*. Bluegill (8.08) and emerald shiner (3.29) were the next most abundant.

Small Hoop Net

Channel catfish had the highest mean *C/f* (1.12) for small hoop nets (Table 2.4.5) in the TWZ stratum. The next most abundant taxa were flathead catfish (0.41), rock bass (0.16), and freshwater drum (0.16).

Large Hoop Net

Freshwater drum had the highest mean *C/f* (1.39) in large hoop nets at the TWZ fixed sites (Table 2.4.6). Silver redhorse (1.15) and black crappie (0.74) were the next most abundant fishes.

Seine

For fixed-site BWCS seining (Table 2.4.7), spotfin shiner (mean *C/f* = 44.38) was most abundant, followed by emerald shiner (24.50) and bluegill (6.50). For TWZ fixed sites, spotfin shiner (19.25) had the highest *C/f*, followed by emerald shiner (12.00) and bluegill (7.17).

Trawl

Channel catfish (2.67) had the highest mean *C/f* in TWZ trawls (Table 2.4.8). Following channel catfish were shovelnose sturgeon (1.08) and shorthead redhorse (0.42).

Length Distributions of Selected Species

Length distributions are presented for selected species in Figures 2.2 to 2.19. The length distributions presented may be limited by the size selectiveness of the particular gear. Care should be used when trying to interpret length distributions from samples <100 (Anderson and Neumann 1996); they are presented in this report because of local interest in the species by river managers.

Gizzard Shad

Most gizzard shad collected by electrofishing in Pool 8 during 1993 were less than 7 cm long (Figure 2.2). Sample size was 79 fish. Less than 10% of the gizzard shad were longer than 10 cm. The overall size range was 17–43 cm.

Common Carp

The electrofishing length distribution from 871 common carp (Figure 2.3) showed a large group of fish from 42 to 60 cm long with few fish outside this range. There were no common carp less than 25 cm long. Given the abundance of adults, this paucity of juveniles is puzzling.

Smallmouth Buffalo

Smallmouth buffalo collected by electrofishing showed a different picture from those collected by hoop nets. The 44 smallmouth buffalo collected by electrofishing (Figure 2.4) ranged mostly from 10 to 20 cm long. Few large adults were collected by electrofishing. We collected 72 smallmouth buffalo in tandem hoop net sets (Figure 2.5) in 1993, most of which were longer than 35 cm, with a substantial number more than 50 cm long.

Channel Catfish

The 1993 length distributions for channel catfish using electrofishing (Figure 2.6) and tandem hoop nets (Figure 2.7) were similar. The most abundant size class occurred at 20 cm long. Good numbers of channel catfish were also evenly distributed between 30 and 50 cm long. Sample sizes for electrofishing and tandem hoop netting were 79 and 195 fish, respectively.

Northern Pike

The 1993 northern pike length distribution, represented as 57 fish collected by electrofishing (Figure 2.8), indicated strong numbers of young-of-the-year ranging from 8 to 24 cm long. The length distribution for

20 northern pike collected by fyke netting (Figure 2.9) shows a range of lengths from 20 to 90 cm long, with the largest percentage between 600 and 70 cm long.

White Bass

The most abundant lengths of 184 white bass we collected with electrofishing in 1993 (Figure 2.10) were 16–18 cm and accounted for more than 60% of the total. The complete size range for white bass extended from 2 to 40 cm long.

Bluegill

We collected 651 bluegills during electrofishing in 1993 (Figure 2.11). The electrofishing distribution was skewed toward small fish, represented primarily by bluegills less than 6 cm long. The 858 bluegills collected in fyke nets (Figure 2.12) averaged much larger than those from electrofishing. Still, the largest group of fish was around 10 cm long. The percentage of the bluegill catch from fyke netting that was greater than 15 cm long was about 30%.

Largemouth Bass

The electrofishing length distribution from 305 largemouth bass (Figure 2.13) shows three distinct groups in abundance (around 10, 20, and 36 cm long). Those 10 cm long or less made up about 20% of the catch, whereas those longer than 40 cm made up only about 1% of the catch.

White Crappie

The sample size for white crappie, collected in fyke nets, was 68 fish. The length distribution for white crappie (Figure 2.14) showed an even distribution of medium and large fish. This fish is not abundant in Pool 8, but populations seem to be stable.

Black Crappie

We collected 1,743 black crappie in fyke nets in 1993 (Figure 2.15). Most of the fish collected were from 10 to 20 cm long. We collected few black crappies more than 30 cm long.

Sauger

The sample size for sauger collected by electrofishing in 1993 was 835 (Figure 2.16). The distribution was nearly bell-shaped and ranged from 16 to 22 cm long.

Walleye

We collected 16 walleye in 1993 by electrofishing. Similar to the sauger distribution, the length distribution for walleye was rather bell-shaped, but with a longer right-hand tail (Figure 2.17). The majority of the catch was from 20 to 30 cm long, with another group apparent between 50 and 60 cm long.

Freshwater Drum

The length distribution for freshwater drum collected by electrofishing represents 423 fish (Figure 2.18). Most freshwater drum in the electrofishing catch during 1993 were less than 20 cm long. A similar picture was indicated by 123 drum collected in fyke nets (Figure 2.19). About 40% of the fyke net catch was evenly distributed from 20 to 45 cm long and about 25% were more than 30 cm long.

Table 2.1. Allocation of fish sampling effort among strata by the Long Term Resource Monitoring Program in Pool 8 of the Mississippi River during 1993. Table entries are numbers of successfully completed standardized monitoring collections.

Table page: 1

Sampling period = 1: June 15 - July 31

Sampling gear	BWCS	BWCO	SCB	MCBU	MCBW	IMPS	IMPO	TRI	TWZ	TOTAL

Chapter 3. Pool 13, Upper Mississippi River

by

Melvin C. Bowler

Iowa Department of Natural Resources
Mississippi River Monitoring Station
206 Rose Street
Bellevue, Iowa 52031

Hydrograph

Water levels throughout the sampling periods were considerably higher than the 52-year mean at the Lock and Dam 12 tailwater gage (Figure 3.1). We encountered high water levels throughout the first period (June 15–July 28), and the lowest water levels in the last 2 weeks of the third period (October 18–29). Water levels affected sampling effort in all three periods in 1993, but was especially disruptive to sampling effort in period 1.

Figure 3.1. Daily water surface elevation from Lock and Dam 12 for Pool 13, Upper Mississippi River, during 1993 and mean elevation since 1940. The U.S. Army Corps of Engineers discharge data were obtained from the Environmental Management Technical Center (Wlosinski et al. 1995).

Summary of Sampling Effort

We sampled the fish population in Pool 13 in 1993 using 10 types of gear that were deployed in eight stratum types. A total of 486 samples were allocated during the three periods and 360 samples were completed. Sampling effort was not uniform among all three periods. We completed only 79 samples in the first period, 134 samples in the second, and 147 samples in the third (Table 3.1). High water persisted throughout period 1 and much of period 2. Because many shoreline gears could not be deployed, we omitted all MCBW and TWZ sampling sites during these periods. Of the 360 samples collected, 353 were at stratified random sites and 7 were at fixed sites.

Total Catch by Gear

We collected 19,410 fish representing 65 species and two hybrids. The top five species collected with all gears combined were bluegill (4,163), emerald shiner (3,112), river shiner (2,313), bullhead minnow (1,785), and black crappie (1,487).

We collected 2,230 fish (48 species) by day electrofishing, 1,564 fish (48 species) by night electrofishing, 2,436 fish (31 species, excluding a green sunfish × bluegill) by fyke netting, 1,951 fish (28 species) by tandem fyke netting, 1,901 fish (44 species, excluding a green sunfish × pumpkinseed) by mini fyke netting, 587 fish (26 species) by tandem mini fyke netting, 8,408 fish (44 species) by seining, 72 fish (16 species) by small hoop netting, 231 fish (22 species) by large hoop netting, and 30 fish (4 species) by trawling (Table 3.2).

We collected six western sand darters in 1993, which are listed as a threatened species in Iowa, and we also collected 19 pugnose minnows—this species is listed as being of special concern in Iowa. Other notable species we collected were 3 Mississippi silvery minnows, 1 suckermouth minnow, 2 southern redbelly dace, 5 bluntnose minnows, 3 fathead minnows, 1 creek chub, 7 quillback, 4 white suckers, 1 blue sucker, 2 northern hogsuckers, 1 black buffalo, 2 silver redhorse, 6 stonecat, and 5 smallmouth bass. These species are listed as uncommon, rare, or tributary strays in Pool 13 by Pitlo et al. (1995) and are infrequently encountered in LTRMP sampling.

Random Sampling, Mean *C/f* by Gear and Stratum

Mean catch-per-unit-effort (*C/f*) of dominant fish species for random sampling by gear type and stratum is listed in Tables 3.3.1 to 3.3.9.

Day Electrofishing

Day electrofishing *C/f* (fish/15 min) was highest for common carp (10.41) in the BWCS stratum, emerald shiner (8.36) in the IMPS stratum, emerald shiner (13.08) in the MCBU stratum, common carp (11.00) in the SCB stratum, and common carp (10.44) for all strata combined (Table 3.3.1).

Night Electrofishing

Night electrofishing *C/f* (fish/15 min) was highest for bluegill (60.00) in the BWCS stratum, common carp (11.75) in the MCBU stratum, common carp (35.67) in the SCB stratum, and bluegill (21.92) for all strata combined (Table 3.3.2).

Fyke Net

Fyke netting *C/f* (fish per net-day) was highest for bluegill (26.51) in the BWCS stratum, bluegill (19.17) in the IMPS stratum, and bluegill (25.81) for all strata combined (Table 3.3.3).

Tandem Fyke Net

Tandem fyke netting *C/f* (fish per net-day) was highest for bluegill (32.50) in the BWCO stratum, gizzard shad (1.64) in the IMPO stratum, and bluegill (11.96) for all strata combined (Table 3.3.4).

Mini Fyke Net

Mini fyke netting *C/f* (fish per net-day) was highest for bluegill (36.87) in the BWCS stratum, emerald shiner (7.76) in the IMPS stratum, channel shiner (6.03) in the MCBU stratum, river darter (8.48) in the SCB stratum, and bluegill (13.33) for all strata combined (Table 3.3.5).

Tandem Mini Fyke Net

Tandem mini fyke netting *C/f* (fish per net-day) was highest for bluegill (15.15) in the BWCO stratum, channel catfish (4.64) in the IMPO stratum, and bluegill (5.68) for all strata combined (Table 3.3.6).

Small Hoop Net

Small hoop netting *C/f* (fish per net-day) was highest for bluegill (0.69) in the BWCO stratum, channel catfish (0.17) in the IMPO stratum, channel catfish and bluegill (0.17) in the MCBU stratum, channel catfish (0.18) in the MCBW stratum, channel catfish (0.33) in the SCB stratum, and channel catfish and bluegill (0.21) for all strata combined (Table 3.3.7).

Large Hoop Net

Large hoop netting *C/f* (fish per net-day) was highest for black crappie (2.82) in the BWCO stratum, freshwater drum (0.34) in the IMPO stratum, channel catfish (0.23) in the MCBU stratum, channel catfish (0.25) in the SCB stratum, and black crappie (0.74) for all strata combined (Table 3.3.8).

Seine

Seining *C/f* (fish per haul) was highest for emerald shiner (58.83) in the BWCS stratum, river shiner (40.73) in the IMPS stratum, river shiner (14.88) in the MCBU stratum, emerald shiner (7.20) in the SCB stratum, and emerald shiner (28.06) for all strata combined (Table 3.3.9).

Fixed Sampling, Mean *C/f* by Gear and Stratum

All fixed-site sampling was confined in the TWZ stratum using night electrofishing and trawls. Mean catch-per-unit-effort (*C/f*) of dominant fish species for fixed-site sampling by gear type and stratum is listed in Tables 3.4.1 to 3.4.2.

Day Electrofishing

Night electrofishing *C/f* (fish/15 min) was highest for sauger (32.67; Table 3.4.1).

Trawling

Trawling *C/f* (fish per haul) was highest for channel catfish (4.50; Table 3.4.2).

Length Distributions of Selected Species

Length distributions (expressed as a percentage of total catch by species by gears) for gizzard shad, common carp, smallmouth buffalo, channel catfish, northern pike, white bass, bluegill, largemouth bass, white crappie, black crappie, sauger, walleye, and freshwater drum are illustrated in Figures 3.2 to 3.15. Because data within a single sampling season are taken over a long time and size ranges for certain fish can overlap (e.g., a 6-cm-long bluegill collected early in period 1 is not of the same cohort as a 6-cm-long bluegill collected late in period 3), interpretations in the length distributions should be made cautiously. Length distributions from small samples ($n < 100$) may be included but are not statistically meaningful (Anderson and Neumann 1996).

Gizzard Shad

We collected 183 gizzard shad from day and night electrofishing, with lengths ranging from 6.5 to 34.3 cm (Figure 3.2). Mean length was 12.4 cm, and modal distribution occurred at 12 cm. Few fish longer than 16 cm were collected.

Common Carp

We collected 672 common carp from day and night electrofishing, with lengths ranging from 19.2 to 83.2 cm (Figure 3.3). Mean length was 51.2 cm, and modal distribution occurred at 48 cm, with the majority of fish grouped around 46–54 cm. Young-of-the-year fish (<1.8 cm) were not collected by this gear.

Smallmouth Buffalo

We collected 8 smallmouth buffalo from small and large hoop netting, with lengths ranging from 28.0 to 49.3 cm (Figure 3.4).

Channel Catfish

We collected 31 channel catfish from small and large hoop netting, with lengths ranging from 4.6 to 57.0 cm (Figure 3.5). Mean length was 32.8 cm. About 35% were longer than 38.1 cm (>15 inches).

Northern Pike

We collected 17 northern pike from fyke netting, with lengths ranging from 51.0 to 87.5 cm (Figure 3.6). Mean length was 67.7 cm.

White Bass

We collected 96 white bass from day and night electrofishing, with lengths ranging from 5.5 to 37.5 cm (Figure 3.7). Mean length was 19.1 cm, and modal distribution occurred at 20 cm. Fish less than 14.0 cm are probably age 0 and contributed to 24% of the total catch. About 13% were longer than 22.9 cm (>9 inches).

Bluegill

We collected 553 bluegill from day and night electrofishing, with lengths ranging from 1.5 to 21.0 cm (Figure 3.8). Mean length was 10.8 cm, and modal distribution occurred at 6 cm. About 53% were less than 10 cm (<4 inches) and about 24% were longer than 15.2 cm (>6 inches). We also collected 1,732 bluegill from fyke netting, with lengths ranging from 2.8 to 23.5 cm (Figure 3.9). Mean length was 12.9 cm, and modal distribution occurred at 8 cm. About 31% were longer than 15.2 cm (>6 inches).

Largemouth Bass

We collected 271 largemouth bass from day and night electrofishing, with lengths ranging from 4.6 to 48.3 cm (Figure 3.10). Mean length was 23.9 cm, and modal distribution occurred at 10 and 34 cm. Fish less than 12.0 cm are probably age 0 and contributed to 15% of the total catch. About 12% were longer than 35.5 cm (>14 inches).

White Crappie

We collected 261 white crappie from fyke netting, with lengths ranging from 7.5 to 33.2 cm (Figure 3.11). Mean length was 20.8 cm, and modal distribution occurred at 22 cm. About 64% were longer than 20.3 cm (>8 inches).

Black Crappie

We collected 1,249 black crappie from fyke netting, with lengths ranging from 4.5 to 31.5 cm (Figure 3.12). Mean length was 18.9 cm, and modal distribution occurred at 20 cm. About 49% were longer than 20.3 cm (>8 inches).

Sauger

We collected 177 sauger from day and night electrofishing, with lengths ranging from 12.6 to 45.0 cm (Figure 3.13). Mean length was 24.3 cm, and modal distribution occurred at 24 cm. About 8% were longer than 30.5 cm (>12 inches).

Walleye

We collected 129 walleye from day and night electrofishing, with lengths ranging from 8.6 to 52.9 cm (Figure 3.14). Mean length was 20.7 cm, and modal distribution occurred at 12 cm. About 5% were longer than 38.1 cm (>15 inches).

Freshwater Drum

We collected 258 freshwater drum from day and night electrofishing, with lengths ranging from 4.0 to 55.2 cm (Figure 3.15). Mean length was 18.0 cm, and modal distribution occurred at 10 cm. Fish less than 18 cm are probably age 0 fish and contributed to 57% of the total catch. About 12% were longer than 30.5 cm (>12 inches).

Table 3.1. Allocation of fish sampling effort among strata by the Long Term Resource Monitoring Program in Pool 13 of the Mississippi River during 1993. Table entries are numbers of successfully completed standardized monitoring collections.

Table 3.3.1. Mean catch-per-unit-effort and (standard error) for fishes collected by day electrofishing in Pool 13 of the Mississippi River using stratified random sampling during 1993. The statistics under ALL pertain to unbiased means over all strata sampled using this gear (as indicated by nonmissing entries below and by Table 3.1). See text for definitions of catch-per-unit-effort and standard error.

Chapter 4. Pool 26, Upper Mississippi River

by

Frederick A. Cronin and Dirk W. Soergel

Illinois Natural History Survey
Alton Field Station
4134 Alby Street
Alton, Illinois 62002

Hydrograph

Water levels at Pool 26 are influenced by discharge from the Mississippi, Illinois, and Missouri Rivers. The pool is regulated at a midpool control point by the U.S. Army Corps of Engineers. These factors combine to give Pool 26 a highly fluctuating hydrologic regime. Three sets of hydrographs are shown to accurately represent these fluctuations (Figure 4.1). Gages are located at Lock and Dam 25 tailwater (Winfield Gage), midpool (Grafton Gage), and Lock and Dam 26 impoundment (Alton Gage). Each graph shows 1940–92 daily means and 1993 daily water levels. All three 1993 hydrographs show extreme flooding in Pool 26. The flood surpassed records for elevation and duration. The highest water levels occurred throughout the summer months (June–October). The flooding dramatically affected standard LTRMP fish sampling in 1993. All standard LTRMP fish sampling was suspended and an ancillary floodplain sampling strategy was adopted for much of the field season. This floodplain sampling (not included in the present report) was conducted from June 28, 1993, through August 25, 1993, and is identified in the LTRMP data set by project code E-010.

Figure 4.1. Daily water surface elevation from Winfield, Grafton, and Alton Gages for Pool 26, Upper Mississippi River, during 1993 and mean elevation since 1940. Discharge data were obtained from the U.S. Army Corps of Engineers, St. Louis District.

Summary of Sampling Effort

We collected 116 samples from random sites using eight gears in 1993 (Table 4.1). There were 37 samples collected in the first period and 79 in the third period. The flooding prevented the collection of any standard LTRMP samples in the second period. The greatest effort (31 samples) was expended in the MCBU stratum. The least effort (8 samples) was expended in the IMPO stratum.

Total Catch by Gear

We collected 11,613 fish representing 62 species during the 1993 field season (Table 4.2). The five most numerically abundant species were the gizzard shad (5,286), channel catfish (1,265), unidentified buffalo (712), white bass (618), and bluegill (546). Total number of fish and species collected by gear type were day electrofishing, 6,738 fish of 49 species; fyke nets, 794 fish of 25 species; tandem fyke nets, 519 fish of 16 species; mini fyke nets, 2,209 fish of 45 species; tandem mini fyke nets, 589 fish of 16 species; seines, 142 fish of 9 species; small hoop nets, 356 fish of 10 species; and large hoop nets, 266 fish of 18 species. We collected four species in 1993 that had not been previously collected in LTRMP samples. These species were the fathead minnow, grass pickerel, pirate perch, and starhead topminnow.

Random Sampling, Mean *C/f* by Gear and Stratum

Day Electrofishing

For day electrofishing (Table 4.3.1), gizzard shad had the highest *C/f* in all strata combined (137.41), followed by emerald shiner (35.12) and white bass (22.16). Gizzard shad also had the highest *C/f* in the BWCS (19.72), IMPS (220.50), MCBU (161.09), and SCB (96.00) strata. The second and third highest *C/f* by stratum were BWCS (common carp, 3.80; bluegill, 3.76), IMPS (bigmouth buffalo, 32.75; smallmouth buffalo, 19.00), MCBU (emerald shiner, 21.11; white bass, 16.31), and SCB (emerald shiner, 73.67; common carp, 39.33).

Fyke Net

For fyke netting (Table 4.3.2), bluegill had the highest *C/f* in all strata combined (5.22), followed by white bass (4.69) and black crappie (1.19). In the BWCS stratum, bluegill had the highest *C/f* (43.53), followed by white bass (24.90) and shortnose gar (9.10). Black crappie had the highest *C/f* in the IMPS stratum (14.21), followed by freshwater drum (10.90) and smallmouth buffalo (6.38). White bass had the highest *C/f* in the SCB stratum (2.02), followed by gizzard shad (1.01), channel catfish (0.51), flathead catfish (0.51), and black crappie (0.51).

Tandem Fyke Net

For tandem fyke netting (Table 4.3.3), freshwater drum had the highest *C/f* in both strata combined (29.04), followed by gizzard shad (22.37) and white bass (11.18). In the BWCO stratum, channel catfish had the highest *C/f* (3.79), followed by freshwater drum (3.11) and bluegill (2.42). Freshwater drum had the highest *C/f* in the IMPO stratum (47.18), followed by gizzard shad (37.87) and white bass (18.64).

Mini Fyke Net

For mini fyke netting (Table 4.3.4), channel catfish had the highest *C/f* in all strata combined (76.35), followed by gizzard shad (16.11) and white bass (3.67). The three highest *C/fs* by stratum were BWCS (gizzard shad, 112.15; smallmouth buffalo, 6.54; river shiner, 3.86), IMPS (gizzard shad, 30.34; bigmouth buffalo, 28.19; channel catfish, 20.36), and SCB (channel catfish, 88.71; white bass, 4.08; emerald shiner, 3.09).

Tandem Mini Fyke Net

For tandem mini fyke netting (Table 4.3.5), gizzard shad had the highest *C/f* in both strata combined (31.87), followed by channel catfish (26.23) and bluegill (1.15). Channel catfish had the highest *C/f* in the BWCO stratum (45.50), followed by smallmouth buffalo (2.22) and gizzard shad (1.83). Gizzard shad had the highest *C/f* in the IMPO stratum (52.86), followed by channel catfish (12.76), bluegill (1.82), and freshwater drum (1.82).

Small Hoop Net

For small hoop netting (Table 4.3.6), channel catfish had the highest *C/f* in all strata combined (3.32), followed by common carp (0.21) and white bass (0.20). The highest *C/fs* by stratum were BWCO (channel catfish, 16.96; bluegill, 2.96; smallmouth buffalo, 0.09; river carpsucker, 0.09), IMPO (bluegill, 1.01; freshwater drum, 0.50), MCBU (channel catfish, 3.82; common carp, 0.31; white bass, 0.24), and SCB (channel catfish, 1.60; smallmouth buffalo, 0.12; blue catfish, 0.12; white bass, 0.12).

Large Hoop Net

For large hoop netting (Table 4.3.7), smallmouth buffalo had the highest *C/f* in all strata combined (1.78), followed by channel catfish (0.34) and flathead catfish (0.25). Smallmouth buffalo also had the highest *C/f* for the BWCO stratum (9.62), followed by bluegill (1.88) and river carpsucker (1.70). River carpsucker had the highest *C/f* in the IMPO stratum (1.26), followed by black crappie (1.01), white bass (0.50), and white crappie (0.50). Smallmouth buffalo had the highest *C/f* in the MCBU stratum (2.34), followed by flathead catfish (0.33) and channel catfish (0.17). Channel catfish had the highest *C/f* in the SCB stratum (0.69), followed by smallmouth buffalo (0.10) and flathead catfish (0.10).

Seine

The only stratum sampled by seining was the SCB (Table 4.3.8). Gizzard shad had the highest *C/f* (25.50), followed by channel catfish (5.00) and emerald shiner (2.75).

Length Distributions of Selected Species

Length distributions are presented for selected species in Figures 4.2 to 4.14. The length distributions for some gears may be limited by the size selectiveness of the particular gear. Length distributions from small samples ($n < 100$) may be included but are not statistically meaningful (Anderson and Neumann 1996).

Gizzard Shad

The electrofishing length distribution from 3,546 gizzard shad (Figure 4.2) is characterized by one large group with a mode of 8 cm and a relatively small group near 24–26 cm.

Common Carp

The electrofishing length distribution from 215 common carp (Figure 4.3) shows three distinct size groups: one between 2 and 8 cm, one between 20 and 30 cm, and one with a mode of 50 cm.

Smallmouth Buffalo

The electrofishing length distribution from 170 smallmouth buffalo (Figure 4.4) is characterized by a large group of small fish (2–6 cm). Most of the remaining fish are between 10 and 30 cm, with a few fish longer than 40 cm. The hoop net length distribution from 162 smallmouth buffalo (Figure 4.5) shows more large fish, mostly between 30 and 50 cm.

Channel Catfish

The electrofishing length distribution from 154 channel catfish (Figure 4.6) shows many young fish between 4 and 10 cm, and the remainder spread between 20 and 60 cm. The hoop net length distribution from 309 channel catfish (Figure 4.7) shows a mode length of 24 cm.

White Bass

The electrofishing length distribution from 206 white bass (Figure 4.8) is characterized by a distinct length group between 10 and 20 cm. A few smaller fish are also present.

Bluegill

The electrofishing length distribution from 165 bluegill (Figure 4.9) shows a fairly even distribution between 2 and 20 cm, with a mode length of 6 cm. The fyke net length distribution from 284 bluegill (Figure 4.10) shows mostly larger fish, with a mode length of 14 cm.

Largemouth Bass

The electrofishing length distribution from 65 largemouth bass (Figure 4.11) shows fish ranging from 0 to 44 cm, with a mode length of 12 cm.

Black Crappie

The fyke netting length distribution from 89 black crappie (Figure 4.12) appears bimodal, with a peak at 10 and 20 cm.

Freshwater Drum

The electrofishing length distribution from 91 freshwater drum (Figure 4.13) is characterized by a group near 10 cm and the remainder between 20 and 60 cm. The fyke netting length distribution from 252 freshwater drum is very similar, with a mode length of 12 cm and a maximum length of 56 cm (Figure 4.14).

Table 4.1. Allocation of fish sampling effort among strata by the Long Term Resource Monitoring Program in Pool 26 of the Mississippi River during 1993. Table entries are numbers of successfully completed standardized monitoring collections.

Jackson, Missouri 63755

Hydrograph

Open Mississippi River water stages are influenced by discharges from the Upper Mississippi, Missouri, Illinois, and to a lesser extent, Ohio Rivers. Water stage may frequently fluctuate in the open river by 3–5 feet/week and more than 20 feet/year. At stages above 22.0 feet (Cape Girardeau Gage, 326 feet above mean sea level), successful gear sets are reduced by high water velocity and flooded riparian vegetation. At stages between 22.0 and 17.0 feet, wing dams become totally to partly submerged. Water velocity above submerged wing dams limits the use of most sampling gear. At stages below 17.0 feet, closing structures emerge making it difficult to access side channels. Gear must be carried in or private landowner permission must be granted to access isolated waters. The SCB is the most difficult stratum to sample, primarily because of access problems.

During the flood of 1993, river stage at Cape Girardeau reached 48.4 feet, the highest flood crest recorded since records were kept in 1891. In 1993, water stages were unusually higher than normal in spring, summer, and fall, but were near normal in winter. The water stage typically fluctuated 4–10 feet during 2-week periods. The lowest stage occurred on March 1 (17.0 feet) and the highest stage occurred on August 8 (48.4 feet). Water stages during LTRMP sampling in 1993 could be characterized as high and unstable (Figure 5.1). The U.S. Army Corps of Engineers discharge data were obtained from the Environmental Management Technical Center (Wlosinski et al. 1995).

Figure 5.1. Daily water surface elevation from Cape Girardeau Gage for the Upper Mississippi River Open Reach, during 1993 and mean elevation since 1940. The U.S. Army Corps of Engineers discharge data were obtained from the Environmental Management Technical Center (Wlosinski et al. 1995).

Summary of Sampling Effort

In 1993, 405 random and fixed-site samples were planned consisting of 135 samples in each of three periods. We planned 336 random samples in three strata: MCBU (composing 27% of the total planned random sampling effort), MCBW (25%), and SCB (48%). We also planned 69 samples in three fixed sites—two TRI (52%) and one MCBU stratum (49%).

We completed 100 samples (25% of what we planned to do) in 1993 consisting of 24 and 76 samples in periods 1 and 3, respectively (Table 5.1). We completed 79 random samples, 21 TRI fixed-site samples and 8 MCBU fixed-site samples. Flood conditions were responsible for the low number of completed samples in 1993. No MCBW sites were sampled in 1993.

Total Catch by Gear

Historically, 129 fish species have been collected from the open river (Pitlo et al. 1995). In 1993, we collected 66 species and one hybrid representing 17,642 fish (Table 5.2). This total does not include 276 fish <30 mm long identified only to genus, or identified as larval fish. The five most numerically abundant species were black crappie (7,120), gizzard shad (6,057), white bass (1,701), freshwater drum (609), and white crappie (384).

The following summarizes total fish catch and number of species by gear: day electrofishing, 5,606 fish and 36 species; fyke netting, 10,396 fish and 29 species (including 6,500 black crappie in one net); mini fyke netting, 1,283 fish and 52 species and 1 hybrid; small hoop netting, 212 fish and 13 species; large hoop netting, 98 fish and 14 species; and gill netting, 47 fish and 14 species.

In 1993, nine new species were collected: central stoneroller, golden shiner, tadpole madtom, pirate perch, flier, redear sunfish, logperch, slenderhead darter, walleye, and green sunfish × orangespotted sunfish. Two Missouri-listed species were collected: mooneye and blue sucker. The blue sucker is a candidate for Federal listing.

Random Sampling, Mean *C/f* by Gear and Stratum

Day Electrofishing

Gizzard shad (91.45 fish/15 min), freshwater drum (14.41), and green sunfish (13.31) had the highest day electrofishing *C/f* when combining all strata (Table 5.3.1). The highest *C/f* by stratum were MCBU: gizzard shad (95.50), freshwater drum and green sunfish (14.75, note standard error), and white bass (8.50); and SCB: gizzard shad (61.71), freshwater drum (11.90), and white bass (5.57).

Fyke Net

White bass (8.61 fish/net-day), freshwater drum (8.03), and goldeye (2.98) had the highest fyke netting *C/f* in SCB stratum (Figure 5.3.2). Fyke nets were set in other strata, but fish species were not caught with sufficient frequency for data analysis.

Mini Fyke Net

Freshwater drum (6.92 fish/net-day), gizzard shad (6.28), and bigmouth buffalo (4.53) had the highest mini fyke netting *C/f* when combining all strata (Table 5.3.3). The highest *C/f* by stratum were MCBU: freshwater drum (7.45), gizzard shad (6.63), and bigmouth buffalo (4.34); and SCB: bigmouth buffalo (5.92), channel catfish (4.65), and gizzard shad (3.69).

Small Hoop Net

Channel catfish (1.10 fish/net-day), white bass (0.35), and freshwater drum (0.33) had the highest small hoop netting *C/f* when combining all strata (Table 5.3.4). The highest *C/f* by stratum were MCBU: freshwater drum and white bass (0.38), channel catfish (0.26), and flathead catfish (0.13); and SCB: channel catfish (7.36), flathead catfish (0.39), and shortnose gar (0.20).

Large Hoop Net

Gizzard shad (1.38 fish/net-day), river carpsucker (0.58), and smallmouth buffalo (0.38) had the highest large hoop netting *C/f* when combining all strata (Table 5.3.5). The highest *C/f* by stratum were MCBU: gizzard shad (1.52), river carpsucker (0.63), and flathead catfish (0.24); and SCB: smallmouth buffalo (1.46), gizzard shad (0.39), and channel catfish (0.37).

Fixed Sampling, Mean *C/f* by Gear and Stratum

Day Electrofishing

Gizzard shad (326.63 fish/15 min), goldeye (6.50), and silver chub (3.00) had the highest day electrofishing *C/f* in the MCBU stratum (Table 5.4.1). Gizzard shad (1,113.33), white bass (53.67), and white crappie (33.33) had the highest *C/f* in the TRI stratum.

Fyke Net

Black crappie (3,504.59 fish/net-day), gizzard shad (632.65), and white crappie (62.24) had the highest fyke netting *C/f* (note standard error) in the MCBU stratum (Table 5.4.2). White bass (195.68), white crappie (16.54), and yellow bass (14.19) had the highest *C/f* in the TRI stratum.

Mini Fyke Net

Black crappie (59.93 fish/net-day), freshwater drum (59.28), and white crappie (4.26) had the highest mini fyke netting *C/f* in the MCBU stratum (Table 5.4.3). Bluntnose darter (6.24), mud darter (6.18), and freshwater drum (3.39) had the highest *C/f* in the TRI stratum.

Small Hoop Net

White bass (10.48 fish/net-day) and freshwater drum (0.25) had the highest small hoop netting *C/f* (note standard error) in the MCBU stratum (Table 5.4.4). Small hoop nets were set in other strata, but fish species were not caught with sufficient frequency for data analysis.

Large Hoop Net

White crappie (3.10 fish/net-day), common carp (0.95), and gizzard shad and black crappie (0.48) had the highest large hoop netting *C/f* (note standard error) in the TRI stratum (Table 5.4.5). Large hoop nets were set in other strata, but fish species were not caught with sufficient frequency for data analysis.

Gill Net

Freshwater drum (5.11 fish/net-day), common carp (4.33), and gizzard shad (2.89) had the highest gill netting *C/f* in the TRI stratum (Table 5.4.6). Because of the high river stages, no other stratum were sampled.

Length Distributions of Selected Species

Length–frequency histograms are presented for selected species in Figures 5.2 to 5.15. Meaningful biological interpretation of the histograms is limited because of small sample size or size selectivity of the gear (Anderson and Neumann 1996). Despite these biases, some river managers may find the histograms useful, therefore we have included them in this report. No age–growth data are available at this time for the open Mississippi River study reach.

Gizzard Shad

We collected 4,659 gizzard shad by day electrofishing, and measured 1,758 subsampled gizzard shad for length–frequency (Figure 5.2). The length–frequency distribution was composed largely of 60 12-cm-long fish. The 2,901 unmeasured gizzard shad were not applied to the length–frequency distribution. Most unmeasured gizzard shad were between 6 and 12 cm long.

Common Carp

Thirty-nine common carp were collected by day electrofishing (Figure 5.3). The length–frequency distribution was composed of 22- to 70-cm-long fish, with modes of 30 and 52 cm.

Smallmouth Buffalo

Thirty-two smallmouth buffalo were collected by day electrofishing (Figure 5.4). The length–frequency distribution was composed of 14- to 48-cm-long fish and having a mode at 18 cm.

Thirty-one smallmouth buffalo were collected by small and large hoop nets (Figure 5.5). The length–frequency distribution was composed of 14- to 66-cm-long fish. Most of smallmouth buffalo were between 42 and 56 cm long.

Channel Catfish

Twelve channel catfish were collected by day electrofishing (Figure 5.6). The length–frequency distribution was composed of 4- to 58-cm-long fish.

One hundred thirty-three channel catfish were collected by small and large hoop nets (Figure 5.7). The length–frequency distribution was composed of 14- to 66-cm-long fish and having a mode at 20 cm.

White Bass

Two hundred thirty-four white bass were collected by day electrofishing (Figure 5.8). The length–frequency distribution was composed of 8- to 38-cm-long fish and having a mode at 12 cm.

Bluegill

Thirty-four bluegill were collected by day electrofishing (Figure 5.9). The length–frequency distribution was composed of 2- to 20-cm-long fish and having a mode at 6 cm.

Sixty-nine bluegill were collected by fyke netting (Figure 5.10). The length–frequency distribution was composed of 6- to 20-cm-long fish and having a mode at 8 cm.

Largemouth Bass

Sixteen largemouth bass were collected by day electrofishing (Figure 5.11). The length–frequency distribution was composed of 12- to 18-cm-long fish and having a mode at 18 cm.

White Crappie

Two hundred twenty-five white crappie were collected by fyke netting (Figure 5.12). The length–frequency distribution was composed of 8- to 34-cm-long fish, with modes at 10 and 24 cm.

Black Crappie

We collected 6,901 black crappie with fyke nets and measured 243 subsampled black crappie for length–frequency (Figure 5.13). The length–frequency distribution was composed of 8- to 18-cm-long fish. The 6,658 unmeasured black crappie were not applied to the length–frequency distribution. Most of the unmeasured black crappie were between 10 and 12 cm long. A single fyke net collected 6,500 black crappie in one 24-h set.

Freshwater Drum

One hundred thirty-five freshwater drum were collected by day electrofishing (Figure 5.14). The length–frequency distribution was composed of 4- to 46-cm-long fish, with modes at 6 and 32 cm.

One hundred sixty-three freshwater drum were collected by fyke netting (Figure 5.15). The length–frequency shows a bimodal distribution, with modes at 12 and 30 cm.

Table 5.1. Allocation of fish sampling effort among strata by the Long Term Resource Monitoring Program in the open Mississippi River during 1993. Table entries are numbers of successfully completed standardized monitoring collections.

Chapter 6. La Grange Pool, Illinois

by

Paul T. Raibley, Kevin S. Irons, and Timothy M. O'Hara

Illinois Natural History Survey
Havana Field Station
704 N. Schrader Avenue
Havana, Illinois 62644

Hydrograph

River levels were above average during 1993 except for brief periods at the end of February and May (Figure 6.1). River levels were above flood stage 285 days in 1993; mean water surface elevations suggest that the river was above flood stage for an average of 71 days from 1940 to 1992. The U.S. Army Corps of Engineers discharge data were obtained from the Environmental Management Technical Center (Wlosinski et al. 1995).

Figure 6.1. Daily water surface elevation from Havana Gage for La Grange Pool, Illinois River, during 1993 and mean elevation since 1940. The U.S. Army Corps of Engineers discharge data were obtained from the Environmental Management Technical Center (Wlosinski et al. 1995).

Summary of Sampling Effort

We made 451 collections in 1993—137 in period 1, 154 in period 2, and 160 in period 3 (Table 6.1). Of those, 385 were from randomly selected sites in the BWCS, BWCO, SCB, and MCBU strata. Of the 66 collections from fixed sites, 33 were from the Peoria TWZ fixed site and 33 were from the Bath Chute SCB fixed site.

Total Catch by Gear

Historical records indicate 115 fish species and three hybrid crosses have been collected from the La Grange Pool since the late 1800s (Smith 1979). In 1993, we collected 28,907 fish representing 64 species and three hybrid crosses (Table 6.2). Seven species and one hybrid cross were new records for LTRMP sampling in the La Grange Pool (goldeye, central stoneroller, creek chub, grass pickerel, pirate perch, mud darter, slenderhead

darter, and striped bass × white bass hybrid). The five most numerically abundant species were gizzard shad (9,530), emerald shiner (5,749), white bass (4,668), freshwater drum (1,510), and bluegill (907). Total species collected, excluding hybrids, by gear type were 40 by day electrofishing, 36 by night electrofishing, 29 by fyke netting, 22 by tandem fyke netting, 49 by mini fyke netting, 23 by tandem mini fyke netting, 40 by seining, 15 by small hoop nets, 18 by large hoop netting, 18 by gill netting, and 10 by trawling. Gill nets were an experimental gear and only one species (paddlefish) and one hybrid (striped bass × white bass) caught in gill nets were not caught in other gears. Our combined catch for 1990 through 1993 consisted of 124,171 fish representing 72 species and four hybrid crosses.

Random Sampling, Mean *C/f* by Gear and Stratum

Day Electrofishing

For day electrofishing (Table 6.3.1), gizzard shad had the highest poolwide mean catch-per-unit-effort (*C/f*) of 107.34, followed by emerald shiner (11.50) and white bass (5.15). Gizzard shad also had the highest *C/f* in the BWCS (59.83), MCBU (129.83), and SCB (32.17) strata. Emerald shiner had the second highest *C/f* in the BWCS (2.89), MCBU (13.94), and SCB (22.78) strata, and the third highest *C/f* by stratum were common carp in the BWCS (2.67) and white bass in the MCBU (6.17) and SCB (6.56).

Night Electrofishing

For night electrofishing (Table 6.3.2), gizzard shad had the highest poolwide mean *C/f* of 28.52, followed by freshwater drum (9.64) and white bass (5.32). Gizzard shad also had the highest *C/f* in the BWCS (69.40) and SCB (58.90) strata, and freshwater drum had the highest *C/f* (12.60) in the MCBU stratum. In the BWCS stratum, emerald shiner had the second highest *C/f* (5.20), followed by brook silverside (2.60). In the SCB stratum, freshwater drum had the second highest *C/f* (12.60), followed by white bass (2.90).

Fyke Net

Poolwide mean *C/f* for fyke netting (Table 6.3.3), based solely on BWCS collections, was highest for white bass (57.78), followed by bluegill (10.68) and freshwater drum (7.75).

Tandem Fyke Net

Poolwide mean *C/f* for tandem fyke netting (Table 6.3.4), based solely on BWCO collections, was highest for gizzard shad (9.35), followed by freshwater drum (5.46) and white bass (3.14).

Mini Fyke Net

For mini fyke nets (Table 6.3.5), white bass had the highest poolwide mean *C/f* (48.67), followed by emerald shiner (5.78) and bluegill (5.59). Bluegill had the highest *C/f* in the BWCS stratum (1.61), followed by black crappie (1.55) and black bullhead (1.50). White bass had the highest *C/f* in the MCBU stratum (68.89), followed by bluegill (6.94) and sauger (2.76). In the SCB stratum, emerald shiner had the highest *C/f* (123.49), followed by channel catfish (13.95) and freshwater drum (9.54).

Tandem Mini Fyke Net

Poolwide mean *C/f* for tandem mini fyke netting (Table 6.3.6), based solely on BWCO collections, was highest for channel catfish (6.42), followed by freshwater drum (6.38) and white bass (1.07).

Small Hoop Net

For small hoop nets (Table 6.3.7), common carp had the highest poolwide mean *C/f* (1.60), followed by channel catfish (0.91) and bluegill (0.54). In the BWCO stratum, common carp had the highest *C/f* (1.29), followed by channel catfish (0.64) and bluegill and black bullhead (0.21). Common carp had the highest *C/f* in the MCBU (1.79) and SCB (1.98) strata, followed by channel catfish (1.12) and bluegill (0.78) in the MCBU stratum, and brown bullhead (1.78) and channel catfish (0.61) in the SCB stratum.

Large Hoop Net

For large hoop nets (Table 6.3.8), smallmouth buffalo had the highest poolwide mean *C/f* (3.63), followed by common carp (2.95) and river carpsucker (0.80). In the BWCO stratum, smallmouth buffalo had the highest *C/f* (5.14), followed by common carp (3.02) and river carpsucker and gizzard shad (0.54). Common carp had the highest *C/f* in both MCBU (2.74) and SCB (5.58) strata, followed by smallmouth buffalo (MCBU, 2.71; SCB, 1.30). White bass had the third highest *C/f* (1.22) in the MCBU stratum, whereas channel catfish was the third highest (0.68) in the SCB stratum.

Seine

Gizzard shad had the highest poolwide mean *C/f* (60.30) for seining (Table 6.3.9), followed by emerald shiner (16.08) and white bass (13.50). Gizzard shad had the highest *C/f* in the BWCS stratum (84.20), followed by emerald shiner (45.35) and white bass (43.90). Gizzard shad also had the highest *C/f* in the MCBU stratum (54.46), followed by smallmouth buffalo (12.04) and emerald shiner (5.67). In the SCB stratum, western mosquitofish had the highest *C/f* (38.50), followed by bullhead minnow (17.13) and gizzard shad (14.44).

Gill Net

Common carp had the highest poolwide mean *C/f* (2.52) for gill netting (Table 6.3.10), followed by freshwater drum (0.72) and gizzard shad (0.67). Common carp had the highest *C/f* in the BWCO (4.12), followed by freshwater drum (0.67) and smallmouth buffalo (0.42). Common carp had the highest *C/f* in the BWCS (2.58), followed by gizzard shad (1.91) and freshwater drum (1.42). Common carp had the highest *C/f* in the MCBU (1.39), followed by smallmouth buffalo (0.52) and freshwater drum (0.51). And in the SCB stratum, common carp also had the highest *C/f* (1.95), followed by freshwater drum (0.38) and river carpsucker and smallmouth buffalo (0.37).

Fixed Sampling, Mean *C/f* by Gear and Stratum

Day Electrofishing

Gizzard shad had the highest mean *C/f* (31.33) for day electrofishing (Table 6.4.1) at the SCB stratum, followed by emerald shiner (14.67) and white bass (3.33). At the TWZ stratum, emerald shiner had the highest *C/f* (21.63), followed by gizzard shad (21.46) and common carp (14.71).

Night Electrofishing

For night electrofishing at the SCB stratum (Table 6.4.2), freshwater drum had the highest *C/f* (22.00), followed by white bass (5.83) and gizzard shad (4.17). Freshwater drum had the highest *C/f* (31.00) at the TWZ stratum, followed by gizzard shad (22.50) and white bass (17.17).

Fyke Net

White bass had the highest *C/f* (48.30) in TWZ fyke nets (Table 6.4.3), followed by bluegill (9.78) and freshwater drum (2.60).

Mini Fyke Net

For mini fyke netting at the SCB stratum (Table 6.4.4), emerald shiner had the highest *C/f* (48.47), followed by bluegill (20.48) and white bass (12.42). At the TWZ stratum, emerald shiner had the highest *C/f* (180.58), followed by white bass (35.62) and bluegill (7.80).

Small Hoop Net

Common carp had the highest *C/f* (4.07) for small hoop nets at the SCB stratum (Table 6.4.5), followed by channel catfish (0.70) and freshwater drum (0.08).

Large Hoop Net

Common carp had the highest *C/f* (1.13) for large hoop nets at the SCB stratum (Table 6.4.6), followed by channel catfish (0.34) and freshwater drum (0.26).

Trawl

Channel catfish (4.50) had the highest *C/f* in TWZ trawls (Table 6.4.7), followed by freshwater drum (0.50) and silver chub (0.20).

Length Distributions of Selected Species

Gizzard Shad

A total of 5,666 gizzard shad were collected in 1993 from day and night electrofishing combined (Figure 6.2). Gizzard shad from 10 to 12 cm dominated the catch, with a small peak from 2 to 8 cm.

Common Carp

The length distribution from 426 common carp collected by electrofishing (Figure 6.3) indicated abundant fish from 34 to 52 cm, with relatively few fish outside this range. Some fish less than 10 cm were present, as were some greater than 52 cm.

Smallmouth Buffalo

Of the 170 smallmouth buffalo we collected by electrofishing in 1993 (Figure 6.4), two peaks in length—near 12 and 32 cm—were evident. Smallmouth buffalo from electrofishing ranged in length from 4 to 48 cm.

Hoop net length distributions of 275 smallmouth buffalo showed a peak at 36 cm (Figure 6.5). Hoop nets did not take smaller fish collected by electrofishing. Smallmouth buffalo collected in hoop nets ranged from 12 to 52 cm.

Channel Catfish

The electrofishing length distribution represents only 34 channel catfish. More than 23% of these fish were 10 cm or smaller (Figure 6.6). Electrofishing collected fish ranging from 4 to 60 cm.

Channel catfish from hoop nets ranged in length from 8 to 64 cm (Figure 6.7). From the 147 channel catfish, two peaks were evident, one at 18 cm and the second between 34 and 36 cm.

Northern Pike

No northern pike were collected from the La Grange Pool by electrofishing during LTRMP sampling in 1993 (Table 6.2). Therefore, no length distributions were included for this report. However, two northern pike were collected in mini fyke nets; they were 22 and 36 cm long.

White Bass

We caught 604 white bass during electrofishing in 1993 (Figure 6.8). Fish were almost normally distributed from 4 to 20 cm, the larger peak being at 10 cm, with a smaller peak at 30 cm.

Bluegill

We caught 96 bluegill during electrofishing in 1993 (Figure 6.9). The bluegill ranged in length from 2 to 20 cm with two peaks, one at 4 cm and the second one at 14 cm.

We combined catches from fyke and tandem fyke net sets for a length distribution of 272 bluegill (Figure 6.10). These fish ranged from 4 to 20 cm, with a peak at 10 cm.

Largemouth Bass

The electrofishing length distribution from 108 largemouth bass (Figure 6.11) indicated fish were distributed from 4 to 42 cm, with a peak at 10 cm.

White Crappie

During 1993, we collected 17 white crappie from fyke and tandem fyke nets ranging from 8 to 26 cm (Figure 6.12).

Black Crappie

We caught 55 black crappie in fyke and tandem fyke nets in 1993, ranging from 6 to 26 cm (Figure 6.13).

Sauger

We caught 88 sauger during electrofishing in 1993 (Figure 6.14). Fish lengths ranged from 10 to 48 cm, with a peak between 14 and 20 cm.

Walleye

We caught seven walleye during electrofishing in 1993. Their lengths ranged from 10 to 26 cm. Because of the small sample size, length distributions were not included in this report.

Freshwater Drum

We caught 690 freshwater drum by electrofishing in 1993 (Figure 6.15). Fish lengths were distributed from 4 to 46 cm, with peaks at 12 and 24 cm.

We caught 281 freshwater drum in fyke and tandem fyke nets (Figure 6.16). These fish were distributed from 8 to 36 cm, with peaks at 12 and 24 cm.

Gears: D - Day electrofishing
 N - Night electrofishing
 F - Fyke netting
 X - Tandem fyke netting
 M - Mini fyke netting
 Y - Tandem mini fyke netting

S - Seining
 HS - Small hoop netting
 HL - Large hoop netting
 G - Gill netting
 T - Trawling (4.8-m bottom trawl)

Table 6.3.1. Mean catch-per-unit-effort and (standard error) for fishes collected by day electrofishing in the La Grange Pool of the Illinois River using stratified random sampling during 1993. The statistics under ALL pertain to unbiased means over all strata sampled using this gear (as indicated by nonmissing entries below and by Table 6.1). See text for definitions of catch-per-unit-effort and standard error. Table page: 1

DISTRIBUTION CODE	
13. ABSTRACT (Maximum 200 words) The Long Term Resource Monitoring Program (LTRMP) completed 1,994 collections of fishes from stratified random and permanently fixed sampling locations in six study reaches of the Upper Mississippi River System during 1993. Collection methods included day and night electrofishing, hoop netting, fyke netting (two net sizes), gill netting, seining, and trawling in select aquatic area classes. The six LTRMP study reaches are Pools 4 (excluding Lake Pepin), 8, 13, and 26 of the Upper Mississippi River, an unimpounded reach of the Mississippi River near Cape Girardeau, Missouri, and the La Grange Pool of the Illinois River. A total of 62-78 fish species were detected in each study reach. For each of the six LTRMP study reaches, this report contains summaries of: (1) sampling efforts in each combination of gear type and aquatic area class, (2) total catches of each species from each gear type, (3) mean catch-per-unit of gear effort statistics and standard errors for common species from each combination of aquatic area class and selected gear type, and (4) length distributions of common species from selected gear types.
